

# **APOGEE PYRANOMETERS**

Silicon-cell & Thermopile Series

### Features

Apogee offers **silicon-cell** and **thermopile** pyranometers that are both rated ISO 9060:2018 Class C. Our popular silicon-cell models are less expensive and have a faster response time, but can have errors under cloudy conditions. Our thermopile pyranometers feature a unique, costeffective design with an inexpensive diffuser and blackbody thermopile detector that provides a broader and more uniform spectral response for better performance in all atmospheric conditions.

pogee

### **STABLE MEASUREMENTS**

Long-term non-stability determined from multiple replicate pyranometers in accelerated aging tests and field conditions is less than 2 % per year.

### **UNIQUE DESIGN**

An accurate, cosine-corrected patented design sheds water and dirt for a self-cleaning performance. A heated option is available with a 0.2 W heater to minimize errors caused by dew, frost, or snow.

### **TYPICAL APPLICATIONS**

- Solar panel arrays
- Agricultural, ecological, and hydrological weather networks

### **CALIBRATION TRACEABILITY**

Apogee SP series pyranometers are calibrated through side-by-side comparison to the mean of four transfer standard sensors under a reference lamp. The reference sensors are recalibrated under sunlight in Logan, UT traceable to the World Radiometric Reference (WRR) in Davos, Switzerland.

## **Dimensions**

#### Thermopile Models

### SP-420 USB

Sensor connects to computers and tablets via USB using ApogeeConnect software for Widows and Mac for data logging, graphs, calibration, real-time PPFD readings, and storing downloadable CSV files for further analysis. Sensor can also store 10,000 measurements internally while connected to a stand-alone 5 V DC USB "always-on" power source.

### SP-421 SDI-12

Uses the SDI-12 communication protocol, which is low-power and has the ability to connect multiple sensors to one long bus cable making them ideal for remote locations. Cables only have 3 conductors including a serial data line, a ground, and a 12-volt line. Complex self-calibration algorithms are done in an internal microprocessor making the sensors compatible with a wide variety of data recorders.

### SP-422 Modbus

The SP-422 outputs a digital signal using Modbus RTU digital signal over RS-232 or RS-485, based on wiring configuration. Modbus is open protocol and used by many manufacturers in many industries. Apogee Modbus Sensor Communication Defaults: Modbus RTU Slave address: 0x1 Baudrate: 115200 Data bits: 8 Stop bits: 1 Parity: None Byte order: Big Endian (most significant Byte sent first) \*User configurable values include the baudrate and slave address.
